## Free bass booster apps for pc

Here is a list of the best free bass enhancement software for Windows. These programs are used to increase bass levels of sound. Bass is actually a low-frequency sound ranging from 20 to 200 Hz. Many of the programs included in this list are media players that use tie to enhance bass. The equalizer used by these modes players have different frequency ranges, but can increase a few frequency bands and bass levels. The common frequency bands in which these bass programs are produced are 60 Hz, 31.25 Hz and 62 Hz. Through these media players, you can get a boost of about 15 to 20 decibels. Apart from frequency ranges, you can also use presets such as full bass, bass, triple, etc., to enhance bass levels. A few of the programs listed here work at the system level. This means that you can use any media player to play any audio or video file, and you will still get enhanced bass levels. These system level programs fall down as they do not provide their media players. Some audio editing software that can enhance sound is also included in this list. The main advantage of audio editing software is that you can increase bass levels from some selected portion of the audio. In addition, they also let you save audio in different audio formats. Almost all of these bass enhancement programs support many popular audio formats such as MP3, AAC, WMA, MP2, OGG, M4A, etc. My favorite Bass Booster Windows software is: ViPER4Windows is my favorite audio booster because it runs at the system level and provides a maximum bass increase of up to 18.06 dB. As a result, the voice of other instruments is suppressed. A full 18 frequency tie range is also available in it. Using the equalizer, you can easily change every available frequency between -120 dB to 13 dB. This tie can also be used to change bass, and triple, And various other audio parameters. To select a specific part of the sound, just click and drag the mouse over the time line of the sound. Now, you can easily enhance bass or apply any other effect to the selected audio part. In audacity, you need to export sound in order to save bass enhanced sound in audio formats such as .mp3, .ogg, .flac, .mp2, etc. However, the export option needs a lame .dll enc file in order to export audio in a different audio format.
